This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Graphitic Materials: Intrinsic Hydrophilicity and Its ImplicationsHaitao Liu ^{a,*}, Lei Li ^{b,c,*}^a Department of Chemistry, University of Pittsburgh, Pittsburgh, PA 15260, USA^b Department of Chemical & Petroleum Engineering, Swanson School of Engineering, University of Pittsburgh, Pittsburgh, PA, 15261, USA^c Department of Mechanical Engineering & Materials Science, Swanson School of Engineering, University of Pittsburgh, Pittsburgh, PA, 15261, USA*Corresponding authors: hliu@pitt.edu, lel55@pitt.edu**Abstract**

Graphitic materials are long regarded as model hydrophobic materials. However, recent work has shown that graphite and graphene are much more hydrophilic than previously thought. It was revealed that the commonly observed hydrophobic nature of graphite is due to airborne hydrocarbon contamination that was not considered in previous studies. This perspective highlights these recent developments and discusses their implications to research on water-carbon interactions, wetting transparency, electrochemistry, adsorption and adhesion, and lubrication and wear.

Keywords: carbon; contact angle; surface contamination; electrochemistry; surface properties; wear.
