A theoretical analysis of the energy absorption response of expanded metal tubes under impact loads

H. Hatami , M. Shokri Rad , A. Ghodsbin Jahromi

PII: S0734-743X(16)30697-2
DOI: [10.1016/j.ijimpeng.2017.06.009](https://doi.org/10.1016/j.ijimpeng.2017.06.009)
Reference: IE 2944

To appear in: *International Journal of Impact Engineering*

Received date: 19 September 2016
Revised date: 2 June 2017
Accepted date: 18 June 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Expanded metal tube with $\alpha=0$, have higher η and SEA and the symmetric collapse.
- Increasing the H of drop hammer would increase the X_{crushing} , F_{mean} , F_{peak} and E_a .
- Analytical model can draw the force-displacement curve during dynamic loading.
