This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Small-scale ammunition experiments using moderate bullet speeds are performed.
- 10 percent gelatin blocks are used for the present wound ballistics.
- The effects of bullet shapes, i.e., head angle, diameter, are analyzed.
- Several empirical relationships are presented and compared with the experiment results.
