An impulse-based model for impact between two concrete blocks

Feng Lin , Yu Zhang

PII: S0734-743X(16)30885-5
DOI: [10.1016/j.ijimpeng.2017.04.019](https://doi.org/10.1016/j.ijimpeng.2017.04.019)
Reference: IE 2907

To appear in: *International Journal of Impact Engineering*

Received date: 4 November 2016
Revised date: 12 March 2017
Accepted date: 24 April 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An impulse-based model was proposed to describe motion state of two RC blocks after impact.
- Drop-weight tests were conducted to implement face-to-face collinear impacts.
- Impact behavior which is affected by various parameters is demonstrated.
