This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Dynamic response of boron carbide is studied under uniaxial and confined compression
- A real-time visualization is used to investigate the crack path during the tests
- Collected fragments of the specimens are used to investigate failure mechanisms
- Link between material response, failure visualization and fractography is presented
