Al-Rashed, Influence of localized magnetic field and strong viscosity on the bio-magnetic fluid flow in a rectangular channel, *International Journal of Mechanical Sciences* (2017), doi: [10.1016/j.ijmecsci.2017.07.022](https://doi.org/10.1016/j.ijmecsci.2017.07.022)

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In this paper biomagnetic fluid flow in an enclosure of rectangular channel is considered.
- The flow is under the influence of applied magnetic field and temperature-dependent viscosity variations.
- An electrically conducting magnetic fluid (blood) is discussed which also exhibits magnetization.
- The governing equations are converted in stream function-vorticity-temperature formulation.
- Solutions are obtained numerically by employing upwind scheme together with successive over relaxation.
- Solutions are presented in terms of average Nusselt number, streamlines, isotherms, and vorticity function contours.
- Presence of magnetic source and viscosity variations influences the flow field considerably.
- It is observed that the strength of the vortices and the temperature values increases by magnifying the magnetic intensity and circular contours are generated extensively for the fluid having variable viscosity.
