This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- A new mathematical model for material removal during UAMAF has been developed based on process physics.
- The existence of steady state removal and transient removal has been successfully established during finishing.
- The instantaneous material removal rate has been considered as a function of instantaneous value of surface roughness.
- The various constants of the MRR model were determined by inverse estimation from the experimental observations.
- The maximum difference in predicted and experimental values of total material removal was found to be $\pm 6\%$.
