This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Longitudinal and torsional vibrations of size-dependent rods is studied by nonlocal integral elasticity.
- The developed nonlocal integral models are both self-consistent and well-posed.
- Asymptotic solutions of predicting longitudinal and torsional frequencies are derived for nonlocal integral models.
- Closed-form solutions for longitudinal and torsional dispersion relations are obtained.
- Scaling effect on the dispersion relation and frequencies of CNT, graphene and Si are studied.
