A quantitative model for the risk evaluation of driver-ADAS systems under uncertainty

S. Qiu, N. Rachedi, M. Sallak, F. Vanderhaegen

PII: S0951-8320(17)30595-1
DOI: [10.1016/j.ress.2017.05.028](https://doi.org/10.1016/j.ress.2017.05.028)
Reference: RESS 5848

To appear in: *Reliability Engineering and System Safety*

Received date: 7 August 2015
Revised date: 17 May 2017
Accepted date: 18 May 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A model for assessing the probability of accidents in ADAS systems is proposed.
- The methodology relies on considering several kinds of uncertainties.
- A real use case considering the Car Navigation system (CNS) is proposed.
