This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The presence of a personality disorder increases the risk of intentional self-harm
- Borderline and antisocial personality disorders are especially related to self-harm
- Negative Affectivity and Antagonism are strongly related to suicidal behaviors
- Personality traits are more strongly related to suicidal vs. nonsuicidal self-harm
