Abstract

Objective

Some patients with Obsessive Compulsive Disorder (OCD) think that their obsessive-compulsive beliefs are true. These patients have OCD with poor or absent insight, a clinical profile that poses a challenge to the clinician. The purpose of this study is to characterize the clinical profile of poor insight OCD and study the impact of poor insight on the two year course of OCD.

Method

[☆] The manuscript represents original material, has never been published before, is not under consideration for publication elsewhere, and has been approved by each author. Each author has sufficiently contributed to the manuscript.
