This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We formulate an asymmetric two-country Melitz model of trade and endogenous growth.
- Unilateral trade liberalization increases growth of all countries for all periods.
- And so are the masses and revenue shares of exported varieties, and welfare.
- The model can examine analytically the transitional dynamics caused by policy shocks.
- The model can be applied to other problems involving asymmetric countries.
