This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We study games on networks with peer effects at distance one and strategic substitution at distance two.
- Indirect substitution (local congestion) allows for an interior equilibrium in the region of high largest eigenvalues.
- Equilibrium is proportional to a weighted version of Bonacich centrality.
- The ranking of individual actions can be reverted as an effect of local congestion.
- We provide empirical evidence of local congestion.
