This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We examine the impact of health information in different media outlets on bottled water consumption through consumer learning.
- We develop a random coefficient discrete choice model with Bayesian learning process to capture consumers' learning of health information and changes in their beverage choices over time.
- Consumers are assumed to have initial prior beliefs about the health effect of different beverages and to update their beliefs using health information received from different media.
- Consumers do learn overtime and information from the traditional media (newspapers and magazines) is more informative than social media (online blogs).
- The perceived quality of bottled water kept increasing during our sample period, and this learning process accounted for 24.44% of the industry's revenue, which is about 4.8 billion dollars per year.
- Simulation results suggest that a health campaign is effective in promoting a healthier diet.
