Abstract

This paper examines the determinants of commercial bank retail interest rate pass-through. While providing empirical evidence for interest rate pass-through across countries, based on a panel data model for 122 countries, we observe that retail interest rate adjustment is related to a number of macroeconomic, financial/banking as well as institutional/governance factors. Amongst these, the level of financial market development, banking sector market power and central bank transparency remain key factors. These results are robust for different sub-samples of countries accounting for cross-country heterogeneity and provide important policy implications for central banks in the conduct of monetary policy.

JEL classification: E43; E44; E52; E58; G28

Key words: Retail interest rates; Monetary policy transmission; Panel data; GMM estimates
