To appear in: *Physica A*

Received date: 21 August 2016

Revised date: 29 April 2017

Please cite this article as: X. Zhang, C. Gan, Global attractivity and optimal dynamic countermeasure of a virus propagation model in complex networks, *Physica A* (2017), <http://dx.doi.org/10.1016/j.physa.2017.08.085>

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- (1) This manuscript examines the effects of countermeasures and network topology on viral spread.
- (2) A novel virus heterogenous propagation model and its optimal dynamic countermeasure are proposed and analyzed.
- (3) It is found that our obtained results are contrary to some previous results and countermeasure dissemination to higher-degree nodes is more effective than that to lower-degree nodes.
