This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Social balance theory states that signed networks are structured in a particular way.
- We provide a decentralized dynamic model of relationship configurations.
- A parameter represents the degree to which agents maintain balanced relationships.
- We derive a unique stationary distribution of relationship configurations.
- By using the stationary distribution, we estimate the parameter from real datasets.
