This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlight PHYSA-162128

- A refined generating algorithm for small-world network with a power-law distance distribution is proposed.
- The fundamental network properties is examined while varying shortcut probability and spatial cost.
- By increasing the spatial cost; γ , average path length between nodes get longer while clustering coefficient is improved.
- By increasing the shortcut probability; q , nodes become close, while clustering is deteriorated.
- The dynamical properties of the networks are tested in terms of spatial prisoner's dilemma game.
