This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights:

Mechanisms of the coevolution leading to complex networks formation are proposed.

Power-law degree distribution, high clustering, and small-world effect are generated.

In every model two order-disorder phase transitions of different nature are obtained.

A new characteristic of the second transition point is discovered.
