This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Sampling techniques are compared based on the match of properties between networks.

We apply subgraph induction step to random walk and forest-fire sampling. Induction improves the performance in preserving degree and clustering distribution.

Techniques with induction create denser networks with larger average degree.

We introduce the scheme for selection of the most appropriate sampling technique.
