This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Aubière, August, the 23th 2016

Highlights

- We use the bounded-confidence model, with fixed uncertainties and extremists, for investigating how the population's opinion is resilient to the arrival of a new group
- The resilience of the population only depends on the equivalent energy of the group arrival, this latter being called tipping energy.
- The higher the uncertainty of the moderate agents, the higher the resilience of their moderate mean opinion to the arrival of a new group.
- The single extreme cluster emerges in the case of a null tipping energy
