Title: Reducing global CO₂ emissions with the technologies we have

Authors: Hauke Ward, Alexander Radebach, Ingmar Vierhaus, Armin Fügenschuh, Jan Christoph Steckel

PII: S0928-7655(16)30212-3
DOI: <http://dx.doi.org/doi:10.1016/j.reseneeco.2017.05.001>
Reference: RESEN 1022

To appear in: *Resource and Energy Economics*

Received date: 9-8-2016
Revised date: 28-3-2017
Accepted date: 15-5-2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

We calculate emission reduction potentials resulting from technology exchange.

We consider multiple upstream production inputs and supply chains.

We apply linear optimization to exchange MRIO based sectoral production technologies.

We find that CO₂ emissions could theoretically be reduced by more than 10 gigatons.

Even second-tier production technologies hold large reduction potentials.
