This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Post-normal science and mathematics education in uncertain times: educating future citizens for extended peer communities

Highlights

- A common idea of critical mathematics education and of post-normal science is that the uncertainty and values embedded in technology require critical citizenship
- Critical mathematics education and post-normal science are complementary in that the former discusses how to prepare students for contributing to extended peer-reviews
- In general, schools today do not prepare students for critical citizenship
- A cooperation between the two academic fields may benefit post-normal science in that conditions for contributing to extended peer-reviews can be better understood, and in that ideas from post-normal science can be promoted in education
- Post-normal science can help develop critical mathematics education through ideas and concepts to describe and understand post-normal situations and how to cope with such situations
- Uncertainty concepts from post-normal science are useful for developing classroom activities and research on these
- Uncertainty concepts from post-normal science are challenging when applied on classroom studies because the use requires decisions on borders between them. In principle this breaks with the idea of post-normal science, since the borders may give the appearance of having been determined “objectively”
