### ABSTRACT

An integrated system was developed for automatic and sequential determination of  $\text{NO}_2^-$ ,  $\text{NO}_3^-$ ,  $\text{PO}_4^{3-}$ ,  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$  and  $\text{Mn}^{2+}$  in natural waters based on reverse flow injection analysis combined with spectrophotometric detection. The system operation was controlled by a single chip microcomputer and laboratory-programmed software written in LabVIEW. The experimental parameters for each nutrient element analysis were optimized based on a univariate experimental design, and interferences from common ions were evaluated. The upper limits of the linear range (along with detection limit,  $\mu\text{mol}\cdot\text{L}^{-1}$ ) of the proposed method was 20 (0.03), 200 (0.7), 12 (0.3), 5 (0.03), 5 (0.03), 9 (0.2)  $\mu\text{mol}\cdot\text{L}^{-1}$ , for  $\text{NO}_2^-$ ,  $\text{NO}_3^-$ ,  $\text{PO}_4^{3-}$ ,  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$  and  $\text{Mn}^{2+}$ , respectively. The relative standard deviations were below 5% (n=9-13) and the recoveries varied from  $88.0\pm 1.0\%$  to  $104.5\pm 1.0\%$  for spiked water samples. The sample throughput was about  $20\text{ h}^{-1}$ . This system has been successfully applied for the determination of multi-nutrient elements in different kinds of water samples and showed good agreement with reference methods (slope  $1.0260\pm 0.0043$ ,  $R^2=0.9991$ , n=50).
