This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Graphical Abstract

Loading trace amount of α heterogeneous fibrous nucleating agent PTBBNa in sPS and benzoylated sPS is a good way to investigate strictly the linear crystal growth rate of α and β forms under the same melt condition and the same crystallization temperature range. The results reveal that the trace amount of α nucleating agent PTBBNa loading in samples does not influence the growth rate of α and β forms and the growth rate of β form is faster than that of α form in both sPS and BzsPS-2% (with benzoylation degree of 2%) samples.
