Lewis acid

Bronsted acid

Electrolytic cyclization

ABSTRACT

Developed a convenient and mild one pot synthesis of cyclopentenone derivatives using 1-acetyl-1-cyclohexene and wide range of aldehydes. Aromatic and heterocyclic aldehydes with electron donating and withdrawing groups were conveniently converted to the corresponding cyclopentenone derivatives.

Cyclopentenones are five-membered carbocycles constituting α,β -unsaturated ketone system presenting a core part of various natural products¹ and synthetic intermediates. Reactions of these cyclopentenones result in the total synthesis of various natural products.² Among the few methods available,^{3–5} Nazarov cyclization⁶ of divinyl ketones is widely used to access cyclopentenones and its derivatives. For example, the cyclopentenone skeleton was assembled in the synthesis of complex molecules such as poly-quinone, prostanoids,⁷ and methylenomycin B, a natural cyclopentanoid antibiotic,⁸ through Nazarov cyclization. Nazarov cyclization is the key step in the synthesis of complex molecules such as ligands of the 5HT_{1D} serotonin receptors.⁹ In general, these reactions are catalyzed by Lewis acids¹⁰ or Bronsted acids,^{11,12} which facilitate the formation of pentadienyl cation of divinyl ketones leading to electrolytic cyclization forming cyclopentenone ring. But the synthesis of structurally diverse cyclopentenone derivatives by Nazarov cyclization strategy involves two stages: first, the synthesis of divinyl ketones and second, acid catalyzed conversion of divinyl ketones to cyclopentenone ring system. Instead, herein we report a simple and convenient one pot synthesis of cyclopentenone derivatives starting from 1-acetyl-1-cyclohexene and various aldehydes.

In continuation of our research in developing new synthetic methodologies, we were initially interested in the synthesis of divinyl ketones starting from 1-acetyl-1-cyclohexene (**1**) and various aromatic aldehydes (**2a–j**, Scheme 1). Several attempts were made for the synthesis of divinyl ketones using compound **1** and

Table 1
Optimization of reaction condition with various acids for synthesis of cyclopentenone derivative

Entry	Acid	Solvent	Temp (°C)	Time (h)	Yield ^a (%)
1	EtOH/HCl (10%)	Ethanol	60	16	No reaction
2	—	Polyphosphoric acid (PPA)	80	16	No reaction
3	SOCl ₂ (1.0 equiv)	Dichloromethane	0	1	Intractable product
4	—	Acetic acid	60	16	No reaction
5	—	H ₂ SO ₄	0–25	1	Decomposition
6	H ₂ SO ₄ (1.0–5.0 equiv)	Toluene	60	8	5
7	H ₂ SO ₄ (1.0 equiv)	Acetic acid	60	16	60
8	Triflic acid (1.0 equiv)	Acetic acid	60	16	No reaction
9	H ₂ SO ₄ (1.0 equiv)	Acetic acid	70	8	40
10	H ₂ SO ₄ (1.0 equiv)	Acetic acid	50	16	No reaction
11	H ₂ SO ₄ (0.5 equiv)	Acetic acid	60	16	No reaction
12	H ₂ SO ₄ (1.5 equiv)	Acetic acid	60	8	50
13	H ₂ SO ₄ (2.0 equiv)	Acetic acid	60	8	20

^a Isolated yields.

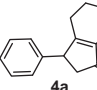

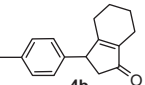

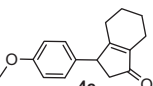

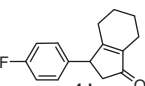

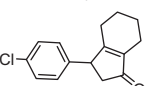

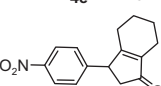

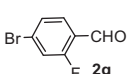

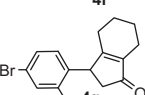

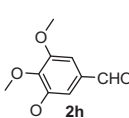

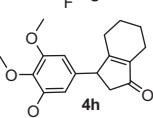

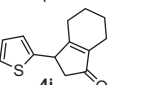

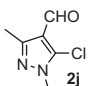

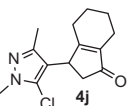

compounds **2a–j** in the presence of aqueous or alcoholic solutions of NaOH. However, the attempts were unsuccessful, as under these conditions, intermediates formed during the aldol addition did not undergo dehydration. Similarly, reactions using LDA or LiHMDS as base followed by acidic work-up resulted in the formation of β -hydroxy ketones that did not undergo dehydration in the presence of several acidic reagents such as SOCl₂, POCl₃, polyphosphoric acid, and H₂SO₄.

The expected α,β -unsaturated product was not obtained even under acidic reaction conditions employing ethanolic HCl, PPA, and H₂SO₄. Interestingly, the reaction of **1** and **2e** using acetic acid and catalytic amount of sulfuric acid under heating conditions furnished unprecedented cyclopentenone derivative **4e** instead of the expected divinyl ketone in low yields.

Encouraged by these results, we decided to optimize the reaction conditions and investigate the scope of this one pot synthetic methodology for cyclopentenone derivatives using variety of aldehydes **2a–j**.

For optimization of reaction condition, we chose 4-chlorobenzaldehyde **2e** as a model substrate and treated with compound **1** under various acidic conditions as shown in Table 1. The reaction in ethanolic HCl, PPA, and CH₃COOH did not proceed and unreacted
