This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

1. Silver ink has been deposited on plastic substrate and silver nanoparticles have been produced
2. 3D control allows both ink superimposing and deposition on complicated surfaces.
3. Polyol method ensures the formation of metallic micropatterns with high uniformity.
4. Substrate wettability, ink volume, and sintering temperature influences deposited patterns.
