This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Evaporation-induced self-assembly was used to prepare patterned TiO₂ substrates.
- Conducting polymers were inkjet-printed onto nanopatterned TiO₂ substrates.
- AFM shows that the deposited polymers are evenly distributed over the substrate.
- The nanopatterned structure is maintained with ultrathin polymer film below ~5 nm.
