This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- We investigate the electron-hole dissociation probability in disordered media
- We show a totally unexpected anomalous behavior for the dissociation probability
- For proper fields and disorder there are maximum and minimum for the dissociation
- Our results can explain anomalous persistent photocurrent in C_{60} crystals
- Moreover, it shed light to the exciton dissociation problem in a D/A system
