Abstract: Here stagnation point flow of an Oldroyd-B fluid towards unsteady stretched sheet is addressed. Mixed convection is present. Heat transfer is examined by considering nonlinear version of thermal radiation and Robin type boundary condition. Implementation of appropriate transformations yields nonlinear ordinary differential systems. Resulting systems have been solved for the convergent solutions. Impacts of different sundry variables on the non-dimensional velocity, temperature and local Nusselt number are scrutinized. It is anticipated that behaviors of thermal relaxation and retardation times on velocity distribution is reverse. Moreover it is also seen that temperature ratio and radiation parameters enhance the temperature distribution.

Keywords: Oldroyd-B fluid; stagnation point flow; mixed convection; nonlinear thermal radiation; convective heat transfer.

1 Introduction

The importance of non-Newtonian material is enhanced dramatically during the past decade.

The recent researchers and scientists are engaged to explore the salient properties of non-
