This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- Novel pre-oxidation procedure to promote external alumina scaling on Ni-base alloy 602 CA
- Different microstructural changes were observed in the bare and pre-oxidised specimens
- Carbides were observed to re-precipitate after initial dissolution in the pre-oxidised specimens
- A quantitative thermodynamic-kinetic description is given for the dissolution and re-precipitation of carbides
- Excellent agreement between experimental and modelling results
