### Abstract

It is of significance to intensively investigate the solid-liquid equilibrium of the  $\text{NH}_3\text{-CO}_2\text{-SO}_2\text{-K}_2\text{SO}_4\text{-H}_2\text{O}$  system to assess the novel aqueous  $\text{NH}_3$  based  $\text{CO}_2$  and  $\text{SO}_2$  combined capture process proposed in our previous work. In this work, the solubility of  $\text{K}_2\text{SO}_4$  in aqueous  $\text{NH}_3$  at various temperatures,  $\text{CO}_2$  and  $\text{SO}_2$  loadings, and  $\text{NH}_3$  concentrations was predicted using Aspen Plus with a developed thermodynamic model package, which can accurately simulate the vapor-liquid equilibrium and the solid-liquid equilibrium of the combined  $\text{CO}_2$  and  $\text{SO}_2$  capture system. The results indicate that the solubility of  $\text{K}_2\text{SO}_4$  increases with temperature and  $\text{CO}_2$  loading, but decreases with  $\text{NH}_3$  concentration. The precipitation starting point of  $\text{K}_2\text{SO}_4$  shift to higher temperature with the increasing of  $\text{SO}_2$  loading and  $\text{NH}_3$  concentration. It is favorable to collect  $\text{K}_2\text{SO}_4$  precipitates at lower  $\text{CO}_2$  loading and temperature, and higher  $\text{SO}_2$  loading and  $\text{NH}_3$  concentration.

### 1. Introduction

Carbon dioxide ( $\text{CO}_2$ ) and sulfur dioxide ( $\text{SO}_2$ ) are two of the main impurities from coal-fired power stations, which could be captured by flue-gas desulfurization (FGD) system and post-combustion  $\text{CO}_2$  capture (PCC) facility [1,2,3]. However, both FGD and PCC systems are very expensive, and cause significant reduction of the power

station efficiency [4]. Aqueous ammonia ( $\text{NH}_3$ ), as an alternative chemical absorbent, has greatly potential to efficiently capture  $\text{CO}_2$  and  $\text{SO}_2$  together [5,6]. A novel post-combustion  $\text{CO}_2$  and  $\text{SO}_2$  combined capture process (without typical FGD system) using aqueous ammonia was proposed in our previous work, as shown in Figure 1, in that both  $\text{CO}_2$  and  $\text{SO}_2$  can be captured in one absorber, the  $\text{CO}_2$  related content in  $\text{CO}_2$  and  $\text{SO}_2$  enriched solvent can be thermally regenerated in a stripper, and the  $\text{SO}_2$  related content can be removed from the rich solvent by integrated sulfite forced oxidation and sulfate precipitation process [7].

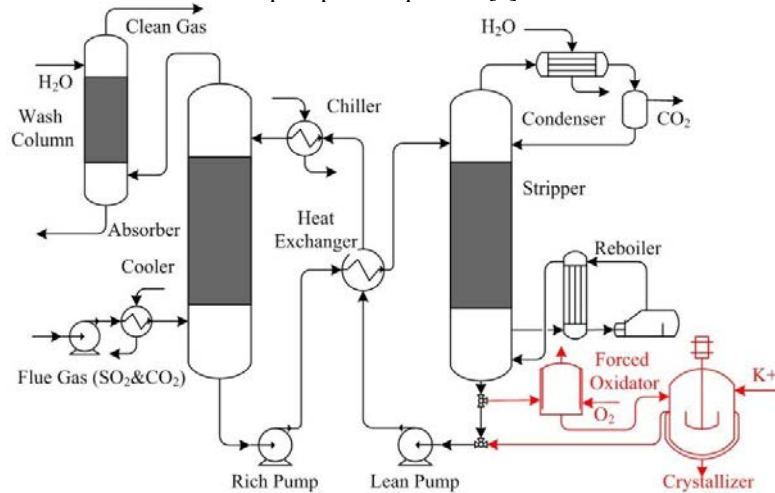

Fig. 1. Proposed combined  $\text{CO}_2$  and  $\text{SO}_2$  capture process without FGD system.

In our previous work, the potassium additives (e.g.  $\text{K}_2\text{SO}_4$ ) are proved and selected as the media for  $\text{SO}_2$  content removal in the combined capture process [5]. However, the detailed study on the solubility of potassium salts in the  $\text{CO}_2$  and  $\text{SO}_2$  loaded aqueous  $\text{NH}_3$  solvent is lacking in literature. Hence, it is of significance to intensively investigate the solid-liquid equilibrium of the  $\text{NH}_3\text{-CO}_2\text{-SO}_2\text{-K}_2\text{SO}_4\text{-H}_2\text{O}$  system and confirm the feasibility of its application in the combined capture of  $\text{CO}_2$  and  $\text{SO}_2$  using aqueous  $\text{NH}_3$ .

In this work, a solid-liquid equilibrium model was built using the Aspen Plus with our developed thermodynamic model package for combined  $\text{CO}_2$  and  $\text{SO}_2$  capture. The package can accurately calculate the solubility of  $\text{K}_2\text{SO}_4$ ,  $\text{K}_2\text{SO}_3$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{KHCO}_3$ ,  $(\text{NH}_4)_2\text{SO}_4$ ,  $(\text{NH}_4)_2\text{SO}_3$ , and  $\text{NH}_4\text{HCO}_3$  between 0 to  $100^\circ\text{C}$ , as shown in Figure 2.
