This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A damage visco-hyperelastic constitutive model is proposed.
- The non-monotonous variation of loss modulus of rubbery materials is explained.
- The thermodynamic dissipation processes behind Payne effect are studied.
- An effective and simple method is developed to identify material parameters.
