This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Propose an advection-reaction-diffusion model with free boundary describe the invasive process of *Aedes aegypti* mosquitoes
- Show that there are two main scenarios of invasive regime: vanishing regime or spreading regime
- Provide an estimate to show that the boundary moving speed cannot be faster than the minimal traveling wave speed
- Results can be applied to help designing effective prevention and control measures for dengue, chikungunya and Zika
