

Quasi-2D Model for Computation of Supercritical Free Surface Flow
in Sudden Expansion

Lyes Amara , Ali Berreksi , Bachir Achour

PII: S0307-904X(17)30077-X

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A simplified and elegant mathematical model, named quasi-2D, is proposed
- 2D shallow water model is converted to an equivalent 1D flow problem
- The proposed approach is less complicated than direct models based on the full 2D model;
- Results obtained are in satisfactory agreement with experiments;
- The proposed model can nicely extended to other analogous problems
