This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Proposes an inventory model for deteriorating items with expiration dates and advance payments.
- The retailer's decision variables are the cycle time and the fraction of no shortages.
- It is shown that the total cost is strictly pseudo-convex in either one of two decision variables.
- The paper provides an optimal solution for arbitrary deterioration rates.
- Some managerial insights are presented.
