This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Linear and Riccati random bilateral matrix differential equations are solved
- Solutions are computed using mean square convergence
- To conduct the study, L^p random calculus is used
- We show some examples where the mean and variance of the solution are computed
