### Abstract

A new spectral problem is introduced, which is indicated to be the negative counterpart of the mKdV spectral problem. Based on the fact, some integrable nonlinear evolution equations are obtained, including the derivative Schwarzian KdV equation, the mKdV5 equation and the sine-Gordon equation. Besides, Lax pairs and finite genus solutions of the equations are given.

*PACS:* 02.30.Jr; 02.30.Ik; 04.20.Jb.

*Keyword:* spectral problem, integrable nonlinear evolution equation, Lax pair, finite genus solution.

### 1 Introduction

Integrable nonlinear evolution equations (NEEs) play an important role in mathematics and physics. An effective approach to study such equations is to treat them as the hierarchies yielded from spectral problems. The idea originated from 1968, in the paper of Lax, a KdV hierarchy was provided [1]. Then in 1970s, Zakharov and Shabat, Ablowitz, Kaup, Newell and Segur, developed the inverse scattering transform method to study NEEs as a hierarchy in a wider context [2,3]. Till now, many famous examples have been presented; for instance, the Camassa-Holm hierarchy [4], the Kaup-Newell hierarchy [5] and the Ablowitz-Ladik hierarchy [6].

And it is worth mentioning that members of a hierarchy share the common features: Lax representations, conservation laws, bi-Hamiltonian structures, etc. In view of this, finding suitable spectral problems is of great significance in the discussion of integrable NEEs.

In the present paper, we will introduce a new spectral problem written as

$$\chi_y = V_{-1}\chi, \quad V_{-1} = \begin{pmatrix} 0 & \lambda^{-1}s^{-1} \\ \lambda^{-1}s & 0 \end{pmatrix}, \quad \chi = \begin{pmatrix} \chi_1 \\ \chi_2 \end{pmatrix}, \quad (1.1)$$

which will be proved to be the negative counterpart of the mKdV spectral problem

$$\chi_x = V_1\chi, \quad V_1 = \begin{pmatrix} u & \lambda \\ \lambda & -u \end{pmatrix}, \quad \chi = \begin{pmatrix} \chi_1 \\ \chi_2 \end{pmatrix}. \quad (1.2)$$
