This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- The integrated system of pulping process and SCWG of black liquor was simulated
- The separator parameters **were** optimized by calculating the phase equilibrium
- Both process using air and oxygen as oxidant in gas combustion were compared
- The mass and energy flow of the integrated system was obtained
- The total energy consumption of pulp production in the form of kgce was obtained
