Exergy analysis of concentrating solar systems for heat and power production

Daniele Cocco, Mario Petrollese, Vittorio Tola

PII: S0360-5442(17)30678-3
DOI: 10.1016/j.energy.2017.04.112
Reference: EGY 10753
To appear in: *Energy*
Received Date: 30 December 2016
Revised Date: 20 April 2017
Accepted Date: 21 April 2017

Please cite this article as: Daniele Cocco, Mario Petrollese, Vittorio Tola, Exergy analysis of concentrating solar systems for heat and power production, *Energy* (2017), doi: 10.1016/j.energy.2017.04.112

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlight:

- The use of concentrating solar systems for providing heat and power is analyzed
- Three different configurations of the heat and power generation section are compared
- An exergy analysis is carried out in order to determine the best option
- Several power-to-heat ratios and steam/hot water temperatures are considered
- The results recommend the best utilization field of each configuration
