12 Abstract

13 This paper presents an approach called, **Enhanced Discrete Fracture Network (EDFN)** for
14 fractured reservoirs modeling. The purpose of this approach is to efficiently represent complex
15 fracture network and accurately simulate the fluid exchange between matrix and fracture. In this
16 approach, fracture network is discretized with a minimum number of grids depending on the
17 fracture intersecting points and fracture extremities. Besides, fracture network naturally
18 decomposes matrix into coarse-scale block with variable geometries, and the partition is
19 optimized by a rapid image processing algorithm. Each coarse matrix block is locally
20 associated with a fracture grid, and it is equivalently discretized to rectangular fine-scale grid
21 blocks. Fine-scale grid blocks are communicated with local fracture grids through one-
22 dimensional flow transport. Therefore, the EDFN model maximally optimizes the discretization
23 process for fractured reservoirs, and it is very appropriate for the simulation of reservoirs with
24 arbitrarily oriented interconnected fractures. Through benchmark with different grid
25 discretization approaches, the EDFN model provides very consistent results and its accuracy is
26 validated. Besides, we also demonstrate that the EDFN model is able to simulate fractured
27 reservoirs with a much smaller number of grid blocks than other approaches. Finally different
28 non-Darcy flow mechanisms in shale gas reservoirs are incorporated into the EDFN model and
29 the impact of those flow mechanisms are investigated.

31 1. Introduction

32 The great challenges to study the fluid flow in fractured reservoirs lie in two aspects, detailed
33 representation the complex fracture network and accurate simulation of the matrix-fracture fluid
34 exchange (Sarda et al., 2001). In the past several decades many researchers have focused on
35 fractured reservoirs simulation. The Dual-Porosity Model is a typical Multi-Continuum Approach
36 (MCA). It was originally proposed by Barenblatt et al. (Barenblatt et al., 1960) and introduced to
37 petroleum industry for fractured reservoirs by Warren and Root (Warren and Root, 1963). Later
