This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Variations of oxygen EUV dayglow are compared between dawnside and duskside of Venus
- ~4-day periodic variations are detected and are dominant on the dawnside of Venus
- The ~4 day periodic dayglow variations may reflect atmospheric dynamics of Venus
