This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- An analytical model is proposed for discussing crater count equilibrium on the surface of an airless body.
- To consider crater count equilibrium, we explicitly formulate the relationship between the number of newly emplaced craters and that of degraded craters.
- We consider cookie-cutting, ejecta-blanketing, and sandblasting to model the crater-degradation processes.
- Applications to the Sinus Medii region and the Apollo 15 landing site on the Moon show that a consistent degradation parameterization can successfully be determined based on the empirical results of these regions.
