Spectral and Photometric Study of the Symbiotic Nova RS Ophiuchus
in Quiet Phase

L. Kondratyeva, F. Rspaev, M. Krugov, A. Serebryanskiy

PII: S1384-1076(17)30030-1
DOI: [10.1016/j.newast.2017.01.011](https://doi.org/10.1016/j.newast.2017.01.011)
Reference: NEASPA 1074

To appear in: *New Astronomy*

Received date: 12 October 2016
Revised date: 16 January 2017
Accepted date: 20 January 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- BVR magnitudes of RS Oph in 2009 – 2016 are presented
- Fabs of emission lines of HI, HeI in spectrum of RS Oph are obtained
- Variations of V/R ratio the of $H\beta$ and $H\alpha$ emission profiles are studied
- Correlation between V/R ratio and radial velocity of absorption is found out
