This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Monodisperse silver nanoparticles of antimicrobial activity were first prepared by a green synthetic way through *Ginkgo Biloba* leaf extract.
- The synthesized AgNPs is of high crystallinity as well as stable and good dispersion with comparatively smaller sizes between 10–16 nm.
- The achieved AgNPs exhibits good antibacterial activities.
- The biosynthesis method is advantageous for its cost effectiveness, availability, portability, nontoxic and environmentally benign.
