This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Wake effect in an amorphous carbon due to a moving proton were analysed.
- The wake potential was calculated based on the dielectric response theory.
- The oscillatory behavior of the potential depends on the proton velocity.
- Effect of electron binding on the wake potential was studied with first principles.
- Quantum oscillator is more compatible with the real material than other models.
