**Abstract**

Gamma ray shielding properties of  $80\text{TeO}_2-5\text{TiO}_2-(15-x)\text{WO}_3-x\text{A}_n\text{O}_m$  glasses, where  $\text{A}_n\text{O}_m$  is  $\text{Nb}_2\text{O}_5=0.01, 5$ ,  $\text{Nd}_2\text{O}_3= 3, 5$  and  $\text{Er}_2\text{O}_3=5$  mole % have been achieved. Shielding parameters; mass attenuation coefficients, half value layers, and macroscopic effective removal cross section for fast neutrons have been computed by using WinXCom program and MCNP5 Monte Carlo code. In addition, by using Geometric Progression method (G-P), exposure buildup factor values were also calculated. Variations of shielding parameters are discussed for the effect of REO addition into the glasses and photon energy.

**Key Words:** Tellurite glasses; shielding Properties; MCNP5
