This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights;

- The nonlinear enhancement mechanisms of parametric sound through different fluid layers have been both numerically and experimentally analyzed.
- A transmittance boundary condition is imposed when solving the Khokhlov-Zaboloskya-Kuznetsov equation.
- The enhancement ratio at the sum and difference frequencies increased with increasing length of the different fluid layer.
