Highlights

- > Near infrared spectroscopy (NIRS) is an emerging neuroimaging tool. > We reviewed 34 studies using NIRS in the field of cognitive aging. > We synthesized the major findings in light with interests and limits of this technique. > We proposed novel perspectives of research using functional NIRS.

Abstract

The cognitive neuroscience of aging is a growing and stimulating research area. The development of neuroimaging techniques in the past two decades has considerably increased our understanding of the brain mechanisms that might underlie cognitive performance and resulting changes due to normal aging. Beside traditional metabolic neuroimaging techniques, such as Positron Emission Tomography and functional Magnetic Resonance Imaging, near infrared spectroscopy (NIRS), an optical imaging technique allowing to monitor real-time cerebral blood oxygenation, has gained recent interest in this field. The aim of the present
