This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In addition to traditional cardiovascular risk factors, in recent years psychosocial risk factors such as stress, mood disorders, low socioeconomic status and sleep disorders have been linked to cardiovascular diseases and hypertension.
 - Such psychosocial factors may have different cardiovascular consequences in men and women.
 - More work is needed to elucidate the pathophysiological mechanisms and to obtain gender-specific data.
-

Gender differences in the relationships between psychosocial factors and hypertension
